## NuCana Announces Presentation on NUC-7738 at the European Hematology Association (EHA) 2022 Hybrid Congress

NUC-7738 Shows Promising Non-Clinical Activity in Acute Myeloid Leukemia

NUC-7738 Kills AML Cells Resistant to Standard Chemotherapy

Data Indicates Potential Clinical Utility Beyond Solid Tumors

Edinburgh, United Kingdom, June 10, 2022 (GLOBE NEWSWIRE) - NuCana plc (NASDAQ: NCNA) announced data to be presented at the European Hematology Association (EHA) 2022 Hybrid Congress highlighting the activity of NUC-7738, a phosphoramidate transformation of 3'-deoxyadenosine (3'-dA), in a broad range of Acute Myeloid Leukemia (AML) cell lines. NUC-7738 has already shown promise as monotherapy in patients with solid tumors in a Phase 1/2 study (NuTide:701) and will also be combined with a PD-1 checkpoint inhibitor.

The data at EHA 2022 show that NUC-7738 can suppress the expansion and survival of AML cells by reducing  $\beta$ -catenin signaling, a key pathway in AML. NUC-7738's effect was observed in multiple different AML cell lines suggesting broad therapeutic potential. Furthermore, it was observed that NUC-7738 resulted in a reduction of the cells that are resistant to standard chemotherapy drugs and thought to be responsible for disease relapse.

These findings, combined with the anti-cancer activity and favorable safety profile of NUC-7738 observed in the NuTide:701 study provide a strong rationale for the evaluation of NUC-7738 in patients with leukemia.

The details of NuCana's poster presentation at EHA are as follows:

**Title:** NUC-7738 regulates  $\beta$ -catenin signaling resulting in reduced proliferation and self-renewal of AML cells

**Abstract Number:** P459

**Presentation Date & Time:** Friday June 10, 2022 from 16:30-17:45 CEST (e-poster online at 9:00 CEST)

**Presenting Author:** Akbar M. Shahid

Hugh S. Griffith, NuCana's Founder and Chief Executive Officer said: "NUC-7738 has entered Phase 2 development in patients with solid tumors and we have been encouraged by the clinical activity and favorable safety profile we have observed. The data presented at EHA indicate that NUC-7738 may have applications beyond solid tumors and we are currently evaluating the optimal pathway for NUC-7738's development for the treatment of hematologic malignancies."

## About NUC-7738

NUC-7738 is a ProTide transformation of 3'-deoxyadenosine (3'-dA), also known as cordycepin. 3'-dA has demonstrated potent anti-cancer activity in non-clinical studies, but has not been successfully developed as an anti-cancer agent due to its rapid breakdown by adenosine deaminase (ADA). NUC-7738 is designed to generate the active anti-cancer metabolite of 3'-dA directly inside cancer cells, thus overcoming 3'-dA's key limitations of breakdown, transportation and activation. The cytotoxic effect of NUC-7738 is largely attributed to the generation of the main active anti-cancer metabolite, 3'-dATP. Primarily, 3'-dATP interferes with RNA polyadenylation, causing changes in the expression of genes involved in metabolism, differentiation, and apoptosis, ultimately leading to metabolic stress, cessation of cancer-cell growth and cell death.

## About NuCana

NuCana is a clinical-stage biopharmaceutical company focused on significantly improving treatment outcomes for patients with cancer by applying our ProTide technology to transform some of the most widely prescribed chemotherapy agents, nucleoside analogs, into more effective and safer medicines. While these conventional agents remain part of the standard of care for the treatment of many solid and hematological tumors, their efficacy is limited by cancer cell resistance mechanisms and they are often poorly tolerated. Utilizing our proprietary technology, we are developing new medicines, ProTides, designed to overcome key cancer resistance mechanisms and generate much higher concentrations of anti-cancer metabolites in cancer cells. NuCana's pipeline includes NUC-3373 and NUC-7738. NUC-3373 is a new chemical entity derived from the nucleoside analog 5-fluorouracil, a widely used chemotherapy agent and is in a Phase 1b/2 study in patients with metastatic colorectal cancer. NUC-7738, is a transformation of a novel anti-cancer nucleoside analog (3'-deoxyadenosine) and is in a Phase 1/2 study for patients with advanced solid tumors.

## Forward-Looking Statements

This press release may contain "forward-looking" statements within the meaning of the Private Securities Litigation Reform Act of 1995 that are based on the beliefs and assumptions and on information currently available to management of NuCana plc (the "Company"). All statements other than statements of historical fact contained in this press release are forward-looking statements, including statements concerning the Company's planned and ongoing clinical studies for the Company's product candidates and the potential advantages of those product candidates, including NUC-3373 and NUC-7738; the initiation, enrollment, timing, progress, release of data from and results of those planned and ongoing clinical studies; the Company's goals with respect to the development, regulatory pathway and potential use, if approved, of each of its product candidates; and the utility of prior non-clinical and clinical data in determining future clinical results. In some cases, you can identify forward-looking statements by terminology such as "may,"
